# Unit 5 Homework: Joint Distributions

*Tako Hisada* 10/7/2017

### 1. Unladen Swallows

```
library(MASS)
set.seed(898)

# Wingspan
w = rnorm(100, mean = 10, sd = 4)
# Velocity
v = 0.5 * w + rnorm(100)

# Our mus
mu = c(10, 5)

Sigma = matrix(c(16, 8, 8, 5), 2, 2)
#munorm()
```

## 2. Broken Rulers

# 3. Great Time to Watch Async

a. Total expected waiting time when you take the Caltrain each morning and each evening for 5 days in a row

```
i <- 0:5
ex = sum(1/6*i)
j <- 0:10
ey = sum(1/11*j)
exy = ex + ey</pre>
```

$$E(X+Y) = E(X) + E(Y)$$
 
$$E(X) = \sum_{x=0}^{5} x * p(x) = 0 * \frac{1}{6} + 1 * \frac{1}{6} + 2 * \frac{1}{6} + 3 * \frac{1}{6} + 4 * \frac{1}{6} + 5 * \frac{1}{6} = 2.5$$
 
$$E(Y) = \sum_{x=0}^{10} y * p(y) = 0 * \frac{1}{10} + 1 * \frac{1}{10} + 2 * \frac{1}{10} + 3 * \frac{1}{10} + 4 * \frac{1}{10} + 5 * \frac{1}{10} + 6 * \frac{1}{10} + 7 * \frac{1}{10} + 8 * \frac{1}{10} + 9 * \frac{1}{10} + 10 * \frac{1}{10} = 5$$
 
$$E(X+Y) = E(X) + E(Y) = 2.5 + 5 = 7.5$$

Since we are being asked for the total expected waiting time when we took the Caltrain for 5 days in a row, we need to multiply this value by 5.

q3a = exy\*5

$$E(X + Y) = 7.5 * 5 = 37.5$$

37.5 minutes

### b. Variance of the total waiting time

```
\begin{split} V(X+Y) &= V(X) + V(Y) + 2*COV(X+Y) \\ V(X) &= E(X^2) - E(X)^2 \\ V(Y) &= E(Y^2) - E(Y)^2 \end{split}
```

```
compExUniform <- function(x) {
   sum = 0
   for(i in 0:x) {
      sum = sum + i * 1/(x+1)
   }
   sum
}
compExUniform(10)</pre>
```

```
## [1] 5
ex = compExUniform(5)
ey = compExUniform(10)

compExUniformSq <- function(x) {
    sum = 0
    for(i in 0:x) {
        sum = sum + i^2 * 1/(x+1)
    }
    sum
}
exx_sq <- compExUniformSq(5)
exy_sq <- compExUniformSq(10)

varx <- exx_sq - ex^2
vary <- exy_sq - ey^2</pre>
```

$$COV(X,Y) = E(XY) - \mu_X \mu_Y$$

```
compExXYUniform <- function(x, mux, y, muy) {
   sum = 0
   for(i in 0:x) {
      for(j in 0:y) {
        sum = sum + ((i-mux)*(j-muy))/((x+1)*(y+1))
      }
      #print(sprintf("END SUM: %f", sum))
   }
   sum
}</pre>
```

```
exxy <- compExXYUniform(5, 2.5, 10, 5)
cov_xy = exxy - ex*ey</pre>
```

Now we can compute V(XY)

```
varxy = varx + vary - 2*cov_xy
```

$$37\frac{11}{12}$$

c. Expected value of the difference between the total evening waiting time and the total morning waiting time over all 5 days

$$E(X - Y)$$

```
i <- 0:5
ex = sum(1/6*i)
j <- 0:10
ey = sum(1/11*j)
exy_diff = abs(ex - ey)</pre>
```

$$E(X-Y) = E(X) - E(Y)$$
 
$$E(X) = \sum_{x=0}^{5} x * p(x) = 0 * \frac{1}{6} + 1 * \frac{1}{6} + 2 * \frac{1}{6} + 3 * \frac{1}{6} + 4 * \frac{1}{6} + 5 * \frac{1}{6} = 2.5$$
 
$$E(Y) = \sum_{x=0}^{10} y * p(y) = 0 * \frac{1}{10} + 1 * \frac{1}{10} + 2 * \frac{1}{10} + 3 * \frac{1}{10} + 4 * \frac{1}{10} + 5 * \frac{1}{10} + 6 * \frac{1}{10} + 7 * \frac{1}{10} + 8 * \frac{1}{10} + 9 * \frac{1}{10} + 10 * \frac{1}{10} = 5$$
 
$$E(X-Y) = |E(X) - E(Y)| = 2.5$$

Since we are being asked for the total expected waiting time when we took the Caltrain for 5 days in a row, we need to multiply this value by 5.

$$q3c = exy_diff*5$$

$$E(X + Y) = 2.5 * 5 = 12.5$$

12.5 minutes

```
i <- 0:10
j <- 0:5

compSum <- function(x, y) {
    sum_x = sum(1/length(x)*x)
    print(sprintf("SUM X: %d", sum_x))
    sum_y = 0
    for(idx in 1:length(y)) {
        sum_y = sum_y + (sum(x) + y[idx] * length(x))
        print(sprintf("Y IDX: %d", y[idx]))
        print(sprintf("SUM Y: %d", sum_y))
    }
}</pre>
```

```
sum_y
}
e_xysq <- compSum(i, j)/60</pre>
